

## HOW TO FIT STABILITY BAR BRACKETS

1. Choose which legs you wish to fit the brackets to.

*For your 6x3 Bar Tent you will use legs 2, 4 & 5*

2. Carefully lay the frame on its side, ideally on a table at working height.

3. Pull out the lower leg tubes from the legs you chose in step 1. Note: *if you pull the lower leg tube fast enough it will come out without the button pins engaging the holes. This saves a lot of time.*

*Legs 3 & 2*

4. Fit the leg brackets as shown in the photo below. The staples should be at the top, and the brackets should be equidistant from the 2 button pin holes. *Make sure that the staples are facing the correct way on each leg.*

5. Using a 4mm Allen Key, tighten each of the 2 grub screws equally till they are firmly secured. Take care not to overtighten since the bracket threads are aluminium, but they should be tight enough so that the brackets do not move when the bars or counters are attached. You can always re-tighten the screws when the tent is erected if necessary.

*Note: the brackets for the Bar Counters have a different form of staple but the same principle applies in both cases*
